

# Neutron rich search and Charge exchange

LNF crew

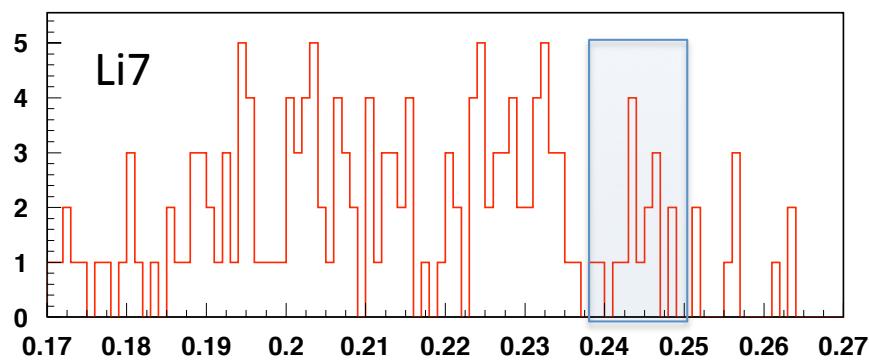

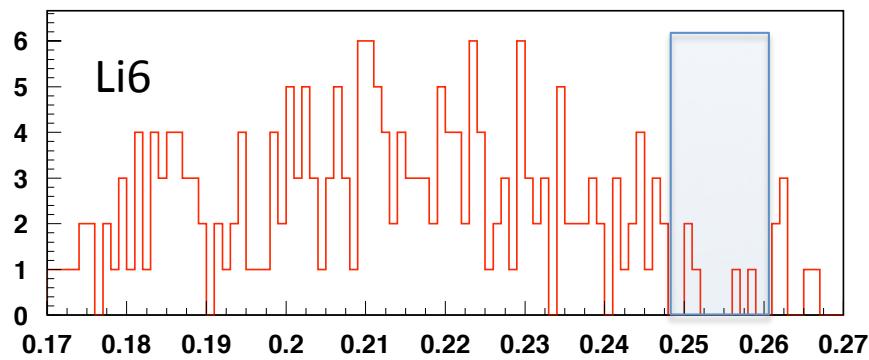

# Neutron rich

- We attempt to find NR as suggested during last OffLine meeting

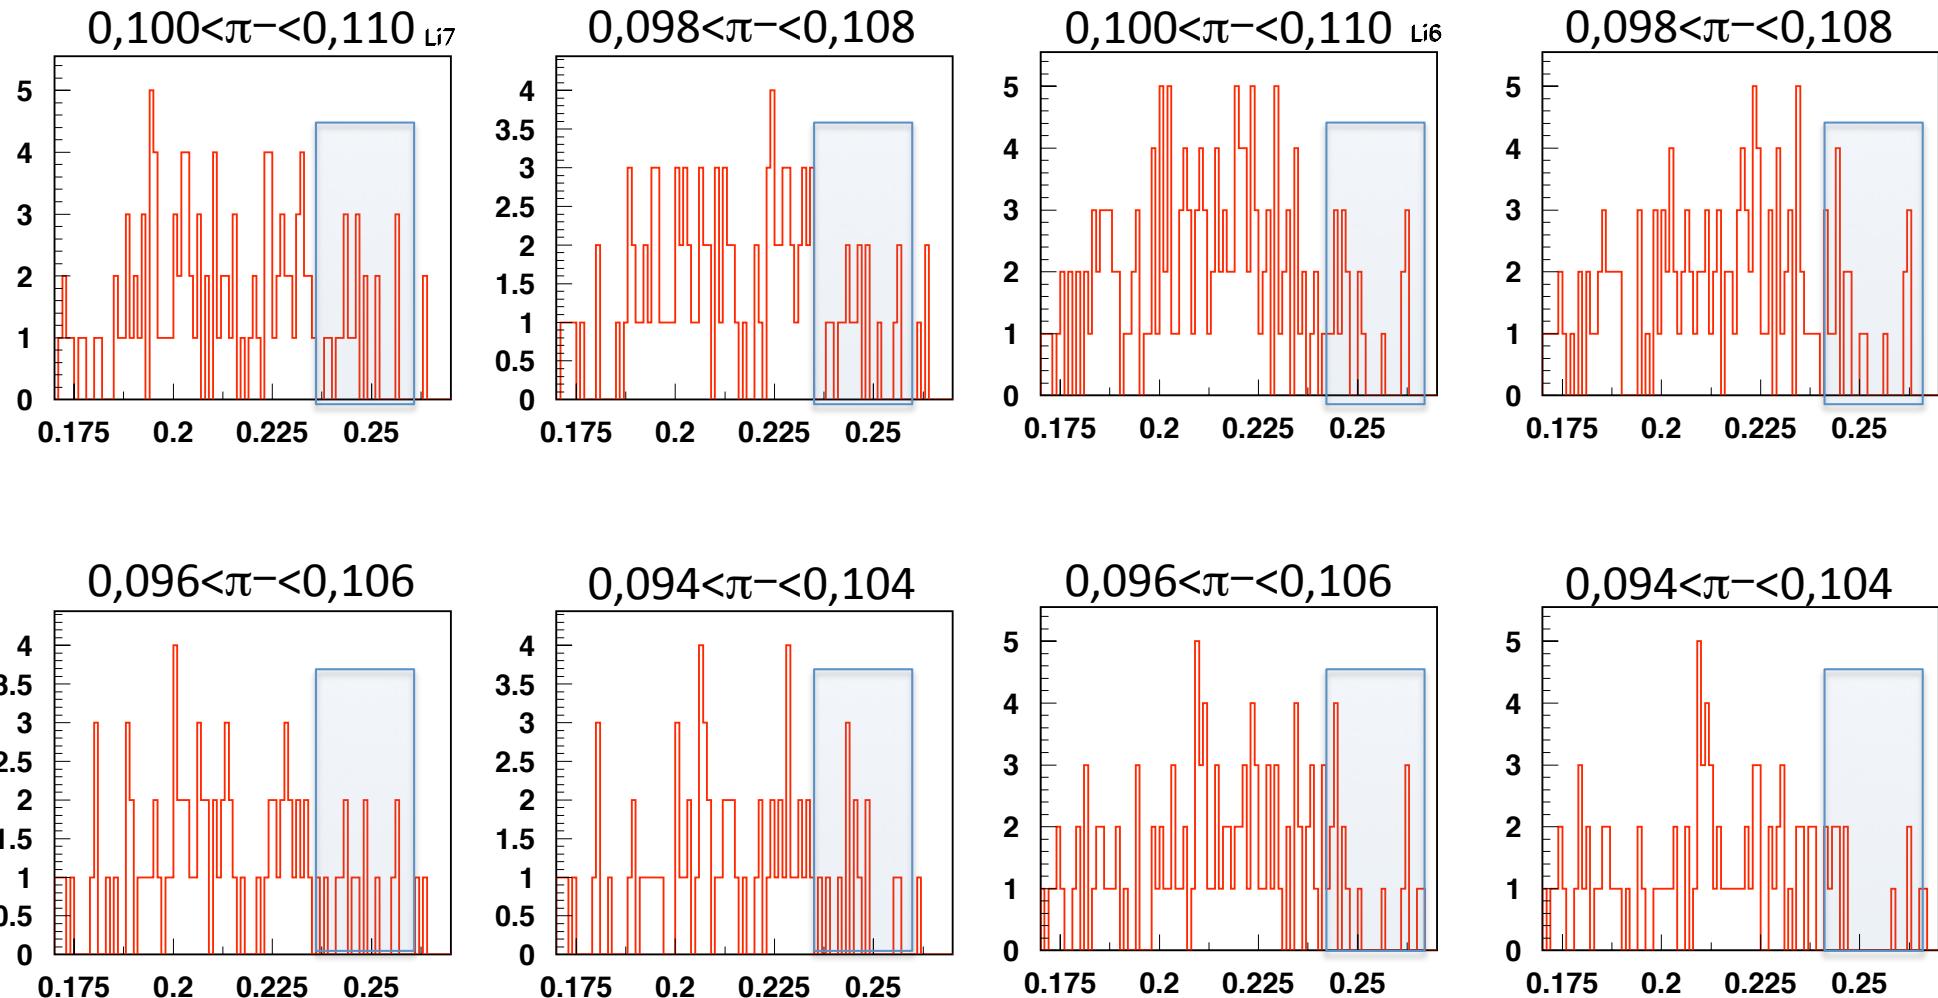

$\pi^+ \pi^-$  coincidence with  $\pi^-$  in the region of MWD (0,09 – 0,110 MeV/c)

In order to clean as much as possible we tried to perform slices of 10 MeV/C of the above interval

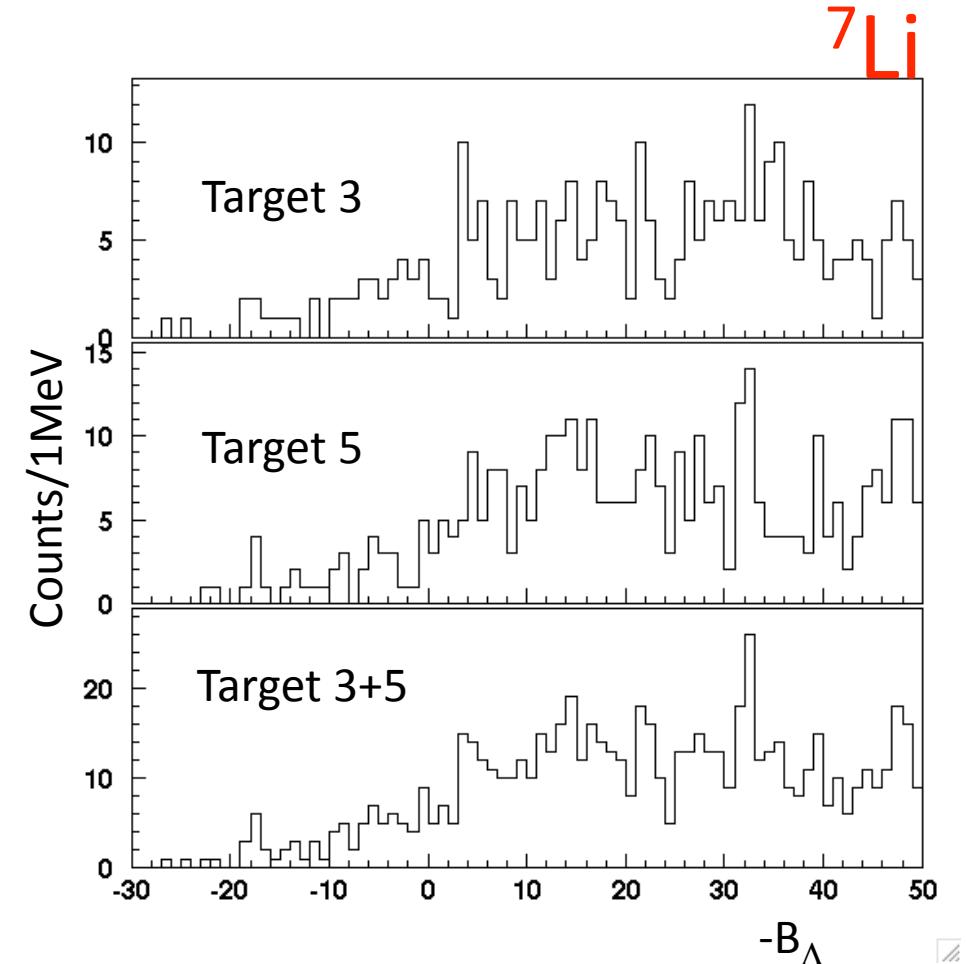

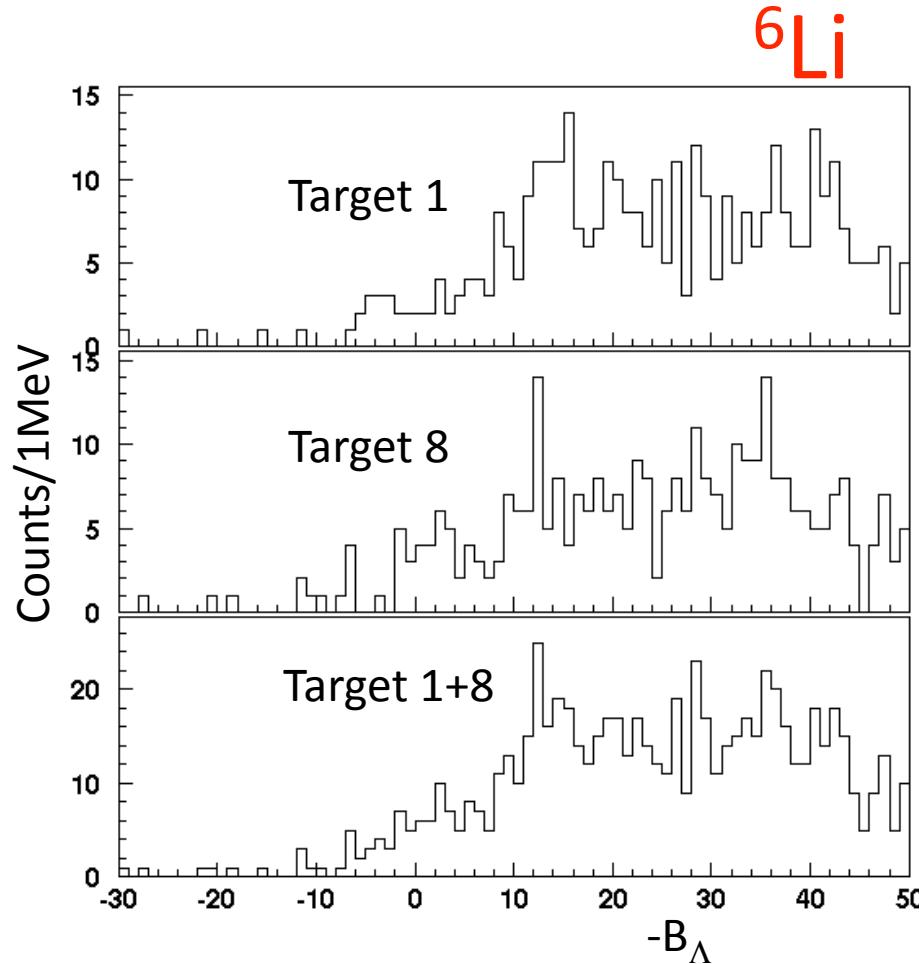

# Neutron rich

# Neutron rich

# Update...looking at binding energy

Binding energy spectra with  $\pi^-$  in coincidence in the window 100-110 Mev/c

*The binding energy is calculated according to the equation used in the published work...*

*Thanks to B. Dalena for the collaboration*

- Maybe some events in the bound region are found...but are the targets correctly added?  
Maybe non aligned in  $B_\Lambda$

Any hints on how to improve the selection?
